

Phylloscopus trochilus is a widespread summer visitor to much of Europe (except the south), which accounts for less than half of its global breeding range. Its European breeding population is extremely large (>56,000,000 pairs), and was stable between 1970–1990. Although there were declines in a number of countries—notably Sweden and Finland—during 1990–2000, populations were stable in Russia and across much of central and eastern Europe, and the species underwent only a small decline overall. Consequently, it is evaluated as Secure.
